

Northwind Robotics

2024 Sustainability Report — Published April 2025

Executive Summary

In 2024, Northwind Robotics reduced its absolute greenhouse gas emissions by 12 percent compared to the 2023 baseline, while revenue grew 19 percent. This report covers Scope 1, Scope 2, and partial Scope 3 emissions and outlines our path to net-zero operations by 2032.

1. Emissions Performance

Metric	2023	2024
Scope 1 (tCO2e)	4,100	3,850
Scope 2 (tCO2e)	6,800	5,400
Scope 3 reported (tCO2e)	21,500	20,900
Renewable electricity	41%	63%

The largest single reduction came from switching the Berlin office and the Austin manufacturing line to certified renewable electricity contracts in mid-2024.

2. Sustainable Travel

Business travel accounts for roughly 14 percent of reported Scope 3 emissions. To address this, the 2025 Travel & Expense Policy introduced a rail-first rule for short European journeys and tightened approval for trips above 5,000 USD. We estimate these measures will avoid approximately 600 tCO2e annually.

3. Product Footprint

Our flagship warehouse robot, the NW-Arc 3, consumes 38 percent less energy per pick than the previous NW-Arc 2 generation. Roughly 71 percent of the NW-Arc 3 chassis by mass is recycled aluminum. End-of-life units are accepted back through the Northwind Reclaim program in all four office regions.

4. Targets and Commitments

- Net-zero Scope 1 and Scope 2 operations by 2032.
- 100 percent renewable electricity across all offices by the end of 2026.
- 50 percent reduction in business-travel emissions per employee by 2028, against the 2023 baseline.
- Zero manufacturing waste to landfill at the Austin line by 2027.

5. Governance

Sustainability strategy is overseen by the Environmental Steering Committee, which reports to the Board quarterly. The committee is chaired by the Chief Operating Officer. Progress against targets is independently assured by an external auditor; the 2024 figures in this report received limited assurance.

6. Methodology Note

Emissions are calculated following the GHG Protocol Corporate Standard. Scope 3 reporting currently covers business travel, purchased goods, and upstream logistics; it does not yet include the use-phase emissions of sold products, which the company plans to add in the 2025 report.
